

MT-Fortis

Reliable substrate feeding

The well-proven MT-Fortis solids feeding system is naturally still included in our range and features a number of perfected details. This system has a single screw system and is particularly suitable for substrates which are easy to transport such as corn silage.

The MT-FORTIS® solids feeding system serves to supply the biogas plant with biomass such as silage or solid manure which cannot be pumped. The dosing tank is a holding tank which can be easily filled with a suitable loading vehicle. In the tank a hydraulic push floor transports the solids to the screw system. This routes the solids to the digester. The system records and documents all components and dosed quantities.

The MT-Fortis is available for volumes of 30, 40, 50 or 60 cubic metres. The 60 cubic metre MT-Fortis can be extended to a capacity of 80 cubic metres by means of an extra top section.
